

# EU Drone Days

**Launch of the  
European Drone Strategy 2.0**

**SESAR U-space Showcase**

**Brussels, 29-30 November 2022**

**#EUDroneDays**

# Project partnership

# AURA Objectives

Lay the foundations for the integration of the new entrants in current and future air traffic environment, developing the required concept of operations and validating U-space services information exchanges with ATM systems

AURA project identifies the requirements for U-space information exchange with ATM through SWIM and validates a set of selected U-space services. It defines a novel Collaborative ATM-U-space Concept of Operations which introduces the dynamic use of airspace to ensure segregation between operations

# AURA Solutions

## Solution PJ.34-W3-01: Collaborative U-space – ATM Interface

Medium-term concept focused on the data exchange between U-space and ATM systems in terms of information to be shared.

Generation of a set of basic services permitting the information exchange through SWIM as middleware of the ATM - U-space interface.

## Solution PJ.34-W3-02: Highly-automated Collaborative U-space – ATM Environment

Medium- to long-term concept for a collaborative

ATM-U-space environment.

Facilitates seamless operations of drones and manned aviation in non-segregated airspace.

Relies on systems with high automation levels and a fully dynamic airspace management.

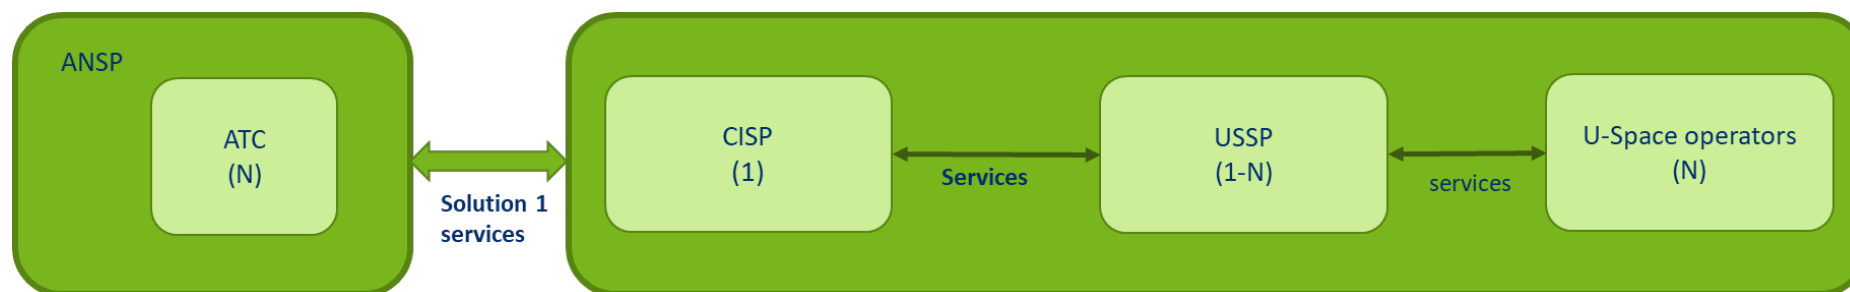

# Solution 1

Designed 5 services to serve ATM and U-Space data exchange, and also CISP – USSP exchange which compose the main architecture of ATM-U-space interface:

- Operation Plan
- Tracking Information
- Tactical Operation Message
- Traffic Non Conformance Message
- Geofence Information

UAS' areas of operations are assigned dynamically in the moment missions are going to take place. In this way, they are handled dynamically in the tactical phase so that they can be enabled or disabled as needed.

# Solution 1 Exercises

**Validation activities have been divided in clusters.** Each one will be centered on a different geographical area and will focus on different validation exercises, allowing the project to cover the full scope of the problem using a “**divide and conquer**” approach.

Thus, each cluster will be able to tackle with sufficient depth a subset of the **key issues regarding ATM-U-space collaboration and the full set of validations will cover a broad variety of ATC systems and practices across Europe.**

- Cluster 1, led by INDRA and based in Spain
- Cluster 2, led by FRQ (FSP) and based in Austria and Hungary
- Cluster 3, led by DSNB and based in France
- Cluster 4, led by LEONARDO and based in Italy

# Solution 1 Exercises

Some of the use cases to be validated respond to scenarios like...

# Solution 1 Preliminary Results

Increases airspace interoperability and improves the security of operations

Contribute to the creation of new standards

Promote the development and reach the expected economic potential of the drone market

Better situational awareness due to displaying U-space airspace on the radar display

ATCOs are able to perform tasks in a timely and efficiently manner

Roles and responsibilities are adequately defined and perceived by the stakeholders involved

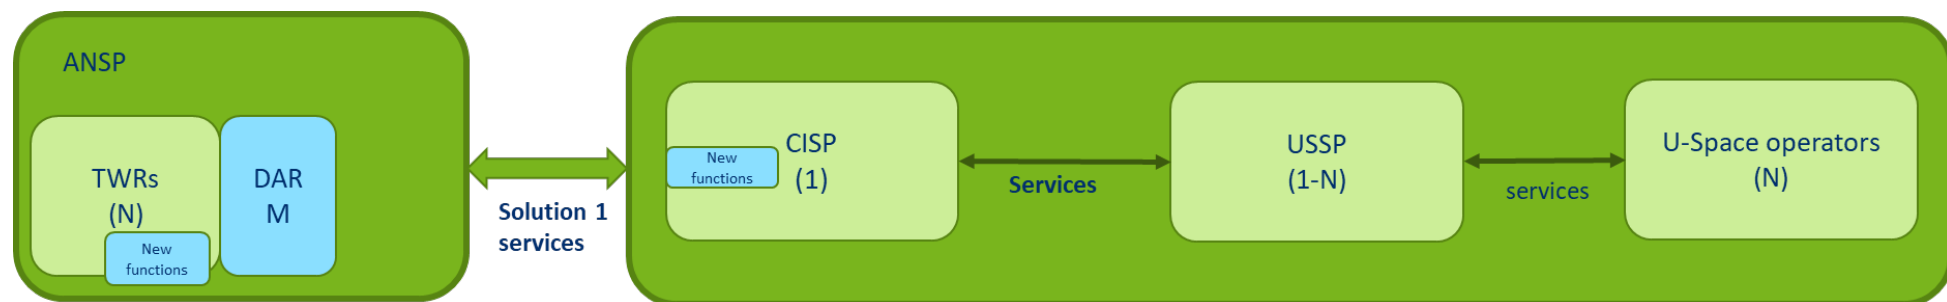

# Solution 2

Designed solution in Mid and Long-Term horizon.

Operational steps defined are:

- Integration of UAV in controlled airspace through Dynamic Airspace Reconfiguration, with volumes extending vertically from the ground up to a **common static ceiling altitude within VLL**.
- Integration of UAV in controlled airspace through Dynamic Airspace Reconfigurations, that are strategically managed by means of airspace volumes with **vertical and lateral extension**.
- Integration of UAV in controlled airspace through Dynamic Airspace Reconfigurations that are **tactically managed by means of airspace volumes** with vertical and lateral extension.

# Solution 2 Exercises

Some of the challenges to be validated in specific use cases and scenarios are...

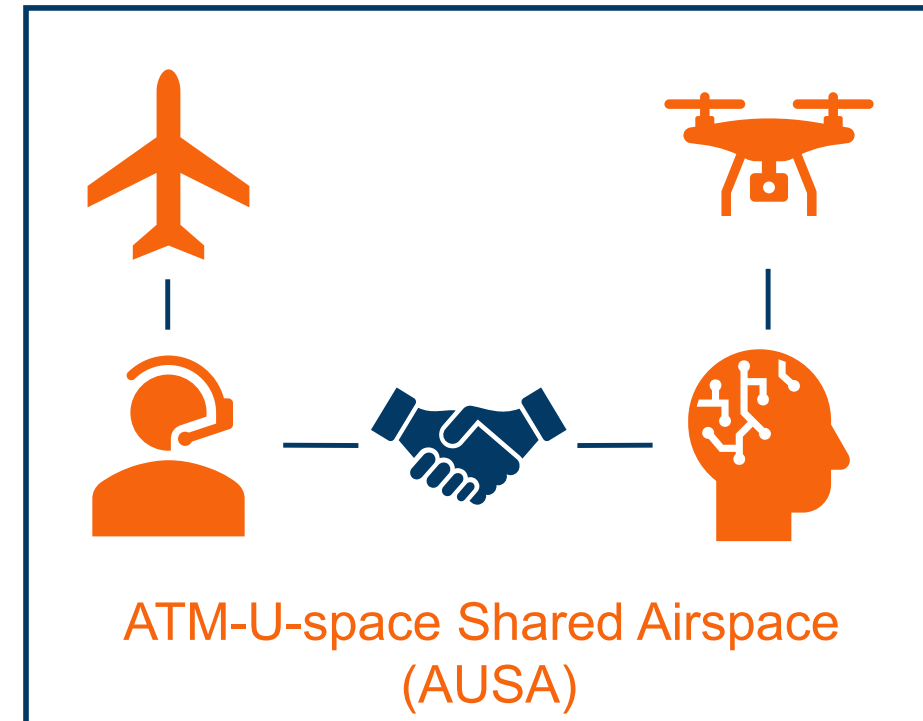

Number of drones  
exceeding those of  
manned aviation  
Ratio 10:1

Most operations are  
BVLOS and highly  
autonomous

High levels of  
automation in the  
ATM-U-space  
processes

New ATM role, the  
Dynamic Airspace  
Reconfiguration  
Manager

Methods to manage  
contingencies and  
non-nominal cases

# Solution 2 exercises

Six exercises addressing some of the challenges with regards to safety and human performance impact.

Human Factors vs. automation in nominal conditions

- Real-Time simulation by ENAIRE

Human Factors and contingencies

- Real-Time simulation by AT-ONE

Drone flight plan definition in AUSA airspace

- Real-Time simulation by INDRA

Adaptative U-space-ATM traffic information exchange

- Real-Time simulation by AIRBUS

Dynamic Airspace Reconfiguration through planning phases

- Fast-Time simulation by AIRBUS

U-space resilience to minimize disruptions

- Fast-time simulation and Workshops by SINTEF/LFV

# Solution 2 Preliminary Results

ATCo situation awareness of manned aircraft was maintained despite the number of drones in AUSA

DAR manager as an independent ATM actor, due to ATCo difficulties to manage pre-tactical and tactical tasks

Need to improve trust on automation to ensure safe separation between manned and unmanned through dynamic airspace reconfigurations

@PJ34 AURA

Visit our dedicated stand  
for more information!

The screenshot shows the PJ34 AURA website header with navigation links: PROJECT, PARTNERS, NEWS & EVENTS, CONTACT. The main banner features the AURA logo, the text "Flying towards the integration of the ATM & U-Space", and a sub-headline: "The integration of drones in airspace will boost and unlock the drone economy, generating benefits for society as a whole." Below this is a social media post for "PJ34-W3 AURA" with the text "Integrating #ATM & U-Space to bring UAVs closer". The social media post includes an AURA logo, a notification bell icon, and a background image of an airport control tower, an airplane, and a drone.

Thank you for your  
attention!
